

100-BIRD KENCHIC LAYER FARM

Poultry Project Proposal • Prepared 20 April 2026 • Kelvitz

1. Executive Summary

This proposal outlines the establishment and operation of a **Layers (Egg Production)** farm with a target capacity of **100 birds**, located at **To be determined**. The project will be managed by **Kelvitz** using 100% commercial feeds and proven biosecurity protocols.

The total estimated capital requirement is **KES 136,000**, with a projected break-even point of **12 months** from the start of production.

2. Business Description

Project Type: Layers (Egg Production)

Legal Structure: Sole Proprietorship (Owner-Operated)

Labour: Owner-managed (zero external labour costs)

Core Values: Biosecurity, animal welfare, commercial feed quality, low-maintenance housing design.

3. Technical Plan

3.1 Housing System: Split Floor (75% Deep Litter / 25% Slatted)

- **Zone A (75% of floor):** Deep litter (wheat husks) with all feeders. No water allowed — litter stays permanently dry.
- **Zone B (25% of floor):** Raised slatted floor over manure pit. Roosting bars above. All droppings fall through for easy collection.
- **Watering:** External 20L jerrycan waterers mounted on slatted-floor mesh wall. Zero spill on deep litter.

3.2 Nesting: Roll-Away (External Collection)

Placed along the exterior wall of the deep litter section. Eggs roll to a padded, lockable external collection trough — preventing predator access, egg-eating, and reducing collection time.

3.3 Feed Management

100% commercial feeds (Chick Mash → Growers Mash → Layers Complete Meal at ~18 weeks). Budget: KES 85,000 to Point of Lay.

4. Feed Schedule

Phase	Weeks	Feed Type	kg/Bird	Bag Cost (50kg)
Chick Mash	0 – 8	High Protein Crumbs	2 kg	KES 4,200
Growers Mash	9 – 18	Grower Mash	5.5 kg	KES 3,800
Layers Complete Meal	18+	Layer Mash	0.12 (per day)	KES 3,500

5. Vaccination Schedule

Age	Vaccine	Method	Notes
Day 1	Marek's Disease	Injection (at hatchery)	Usually done by Kenchic before pickup
Day 5–7	Newcastle (HB1/La Sota)	Eye drop / Drinking water	First dose
Day 10–14	Gumboro (IBD)	Drinking water	First dose
Day 18–21	Newcastle (Booster)	Drinking water	Second dose
Day 24–28	Gumboro (Booster)	Drinking water	Second dose
Week 6	Fowl Pox	Wing web stab	Critical for tropics
Week 8	Newcastle (Komarov)	Injection (IM)	Long-lasting protection
Week 10	Fowl Typhoid	Injection (SC)	Optional but recommended
Week 14–16	Newcastle (La Sota)	Drinking water	Pre-lay booster
Week 16–18	Deworming	Oral (Piperazine)	Before point of lay

6. Financial Projections

TOTAL CAPEX

KES 136,000

MONTHLY REVENUE

KES 37,500

6-MONTH REVENUE

KES 225,000

NET 6-MONTH PROFIT

KES -62,200

CAPEX Breakdown

Item	Amount (KES)
Day-Old Chicks (100 × KES 130)	KES 13,000
Feed (to Point of Lay)	KES 100,000
Vaccines & Medication	KES 5,000
Brooding & Utilities	KES 3,000
Housing / Coop	KES 0
Equipment (Feeders, Drinkers)	KES 15,000
Total CAPEX	KES 136,000

6-Month P&L Projection

Item	Amount (KES)
Gross Revenue (6 months)	KES 225,000
Less: Monthly Feed OPEX × 6 months	- KES 151,200
Less: Total CAPEX	- KES 136,000
Net 6-Month Profit	KES -62,200

Break-Even Estimate: 12 months from start of production (excludes the ~4.5-month growing period before laying begins).

7. Risk Analysis

Risk	Impact	Mitigation
Disease outbreak	High — can cause total flock loss	Strict vaccination schedule, biosecurity protocols, footbaths
Feed price increase	Medium — erodes margins	Buy in bulk, explore alternative protein sources (BSF larvae)
Predator attacks	Medium — loss of birds and eggs	1/2" galvanized mesh, lockable nest boxes, secure coop structure
Egg price drop	Medium — reduced revenue	Diversify sales channels (hotels, direct, wholesale)
Mortality (5-10%)	Low-Medium — increases cost-per-surviving-bird	Budget for 5% mortality buffer, strict brooding management
Water contamination	Medium — disease spread	External waterers, clean water daily, zero-spill design

8. Products & Revenue Streams

- **Table Eggs:** Primary revenue. ~25 eggs/bird/month at KES 15 each.
- **Poultry Manure:** Secondary income. Composted manure sells for KES 200-500 per 50kg bag.
- **Spent Layers:** End-of-cycle birds sold for meat after 18-24 months of laying.

9. Marketing & Sales Strategy

- **Direct sales:** Neighbours, community, word-of-mouth.
- **Local kiosks & shops:** Recurring weekly orders.
- **Hotels & restaurants:** Bulk orders at wholesale price.
- **Branding:** Consistent supply and quality builds reputation over time.

10. Management Plan

Owner-Operator: Kelvitz (sole labour). Daily tasks include:

- Morning: Egg collection, feeding, water refill, health check.
- Afternoon: Second egg collection, feed top-up.
- Weekly: Manure scraping from droppings pit, footbath solution change.
- Monthly: Weight sampling, feed consumption tracking, financial review.
